

Physical Degrees of Freedom for Gauge Fields and the Question of Spin

T. Goldman
(T-2, Los Alamos)

work with

X.S.Chen, X.F.Lu, Sichuan Univ.

W.M.Sun, Fan Wang, Nanjing Univ.

BASIC PRINCIPLEs

Operators must satisfy
the commutation relations
of the physical quantities
that they are meant to represent
in order for their matrix elements
to be identified
with those physical quantities.

~~_____~~
J is a Lorentz invariant **NOT S**

Orbital Angular Momentum (**OAM**) is in the frame of the beholder.

Outline

- I. Spin, boosts and angular momentum
- II. Axial charge, J and a model w/out glue
- III. Lorentz irreps and angular momentum
- IV. **Aside**: Gauge non-Invariance of Hydrogen Eigenenergies/**Update**: INT2012-OAM
- V. Gauge invariance and canonical angular momentum in QED
- VI. Gauge Invariance and canonical commutation relation in QCD
(for nucleon spin operators)
- VII. Conclusion
- VIII. Additional Material (Expt+Thy)

I. Spin, boosts and angular momentum

Binding moves spin from **static non-relativistic** view to include **orbital** contributions

e.g. Electron in hydrogenic atom: (where $\gamma = \sqrt{1 - Z^2\alpha^2}$)

$$\psi \propto \begin{bmatrix} 1 \\ 0 \\ -i \frac{(1-\gamma)}{Z\alpha} \cos\theta \\ i \frac{(1-\gamma)}{Z\alpha} \sin\theta e^{i\phi} \end{bmatrix} \quad \text{but norm} \quad \psi^\dagger \psi \propto \left\{ 1 + \left[\frac{(1-\gamma)}{Z\alpha} \right]^2 [(\cos\theta)^2 + (\sin\theta)^2] \right\}$$

{1st correction at $\mathcal{O}(Z^4\alpha^4)$ }

and so “**spin**”

$$\frac{\psi^\dagger \Sigma_3 \psi}{\psi^\dagger \psi} \propto \frac{1}{1 + \left[\frac{(1-\gamma)}{Z\alpha} \right]^2} \left\{ 1 + \left[\frac{(1-\gamma)}{Z\alpha} \right]^2 [(\cos\theta)^2 - (\sin\theta)^2] \right\}$$

which integrates to

$$\frac{1}{1 + \left[\frac{(1-\gamma)}{Z\alpha} \right]^2} < 1$$

Difference must be made up by orbital

Axial current or generator of rotations?

$$\frac{1}{2}\bar{\psi}\gamma^3\gamma^5\psi = \frac{1}{2}\psi^\dagger\Sigma_3\psi \quad \Sigma_3 = \begin{bmatrix} \sigma^3 & 0 \\ 0 & \sigma^3 \end{bmatrix}$$

from generator of 3-axis rotations:

$$\frac{1}{2}\bar{\psi}\sigma_{12}\psi = \frac{1}{2}\psi^\dagger \begin{bmatrix} \sigma^3 & 0 \\ 0 & -\sigma^3 \end{bmatrix} \psi$$

Same effect for bound state wavefunctions,

but -- $\int(c^2 - s^2) = \int(s^2 - c^2) = 0$

Or recall Melosh: \vec{S}_\perp and \vec{S}_\parallel boost differently + Wigner rotation

Basic Boosts:

Accelerating a polarized fermion
from rest distributes angular
momentum from spin to spin plus
orbital angular momentum

Rest Frame solution
of Dirac equation
for spin up fermion:

$$\psi(x, t) = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} e^{-i(mt - p^\mu x_\mu)}$$

*But if you just run past this state,
Lorentz makes it look like spin and orbital angular momentum!*

Boost FRAME - along spin direction

$$\Psi(p^\mu x_\mu) \rightarrow e^{-i\sigma_{03}\omega/2} \Psi(p^\mu x_\mu)$$

$$= e^{\left\{ -\begin{bmatrix} 0 & \sigma^3 \\ \sigma^3 & 0 \end{bmatrix} \omega/2 \right\}} \Psi(p^\mu x_\mu)$$

$$= \left\{ \cosh(\omega/2) \mathbf{1} - \begin{bmatrix} 0 & \sigma^3 \\ \sigma^3 & 0 \end{bmatrix} \sinh(\omega/2) \right\} \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} e^{-i(Et-pz)}$$

$$= \begin{bmatrix} \cosh(\omega/2) \\ 0 \\ \sinh(\omega/2) \\ 0 \end{bmatrix} e^{-i(Et-px)}$$

$$\cosh(\omega) = E/m$$

$$\sinh(\omega) = p/m$$

$$\cosh(\omega/2) = \sqrt{[1 + \cosh(\omega)]/2}$$

$$\sinh(\omega/2) = \sqrt{[\cosh(\omega) - 1]/2}$$

or in terms of energy and momentum

$$\Psi_L(p^\mu x_\mu) = \sqrt{\frac{E+m}{2m}} \begin{pmatrix} 1 \\ 0 \\ p/(E+m) \\ 0 \end{pmatrix} e^{-i(Et-px)}$$

Cf. $\sigma \cdot p/(E+m) \rightarrow$
Spin-flip + Orbital $L=1$

$\lim p \rightarrow E \rightarrow \infty$! c.f. $p=0$

$$\psi^\dagger \Sigma_3 \psi = \frac{(E+m)^2 + p^2}{2m(E+m)} = \frac{E}{m}$$

$$\bar{\psi} \sigma_{12} \psi = \frac{(E+m)^2 - p^2}{2m(E+m)} = 1$$

Boost FRAME- transverse to spin direction

$$\Psi(p^\mu x_\mu) \rightarrow e^{-i\sigma_{01}\omega/2} \Psi(p^\mu x_\mu)$$

$$= e^{-\left\{ \begin{array}{cc} 0 & \sigma^1 \\ \sigma^1 & 0 \end{array} \right\} \omega/2} \Psi(p^\mu x_\mu)$$

$$= \left\{ \cosh(\omega/2) \mathbf{1} - \begin{array}{cc} 0 & \sigma^1 \\ \sigma^1 & 0 \end{array} \sinh(\omega/2) \right\} \begin{array}{c} 1 \\ 0 \\ 0 \\ 0 \end{array} e^{-i(Et-pz)}$$

$$= \begin{array}{c} \cosh(\omega/2) \\ 0 \\ 0 \\ -\sinh(\omega/2) \end{array} e^{-i(Et-px)}$$

$$\cosh(\omega) = E/m$$

$$\sinh(\omega) = p/m$$

$$\cosh(\omega/2) = \sqrt{[1+\cosh(\omega)]/2}$$

$$\sinh(\omega/2) = \sqrt{[\cosh(\omega)-1]/2}$$

or in terms of energy and momentum

$$\Psi_T(p^\mu x_\mu) = \sqrt{\frac{E+m}{2m}} \begin{array}{|c|} \hline 1 \\ \hline 0 \\ \hline 0 \\ \hline -p/(E+m) \\ \hline \end{array} e^{-i(Et-px)}$$

$$\psi^\dagger \Sigma_3 \psi = \frac{(E+m)^2 - p^2}{2m(E+m)} = 1$$

$$\bar{\psi} \sigma_{12} \psi = \frac{(E+m)^2 + p^2}{2m(E+m)} = \frac{E}{m}$$

Demonstration: A (non-relativistic) MODEL WITHOUT GLUONS

There is **no** proton spin crisis but **only** quark spin-axial charge **confusion**

The quark spin contributions measured in DIS are:

$$\Delta u + \Delta d + \Delta s$$
$$= \left\{ \begin{array}{lcl} 0.82(6) - 0.44(6) - 0.10(7) & = & 0.29(19) \\ 0.80(2) - 0.46(2) - 0.12(2) & = & 0.23(6) \\ 0.82(4) - 0.44(4) - 0.11(4) & = & 0.27(12) \end{array} \right. Q^2 = \left\{ \begin{array}{l} 10 \\ 5 \\ 3 \end{array} \right. GeV^2.$$

while the pure valence q^3 S-wave quark model
calculated values are:

$$\Delta u = \frac{4}{3}, \Delta d = -\frac{1}{3}, \Delta s = 0$$

More recent values for sum:

$$\Sigma = 0.330 \pm 0.011(\text{thry}) \pm 0.025(\text{exp}) \pm 0.028(\text{evol}) \quad \text{Hermes}$$

$$\Sigma = 0.33 \pm 0.03(\text{stat}) \pm 0.05(\text{syst}) \quad \text{COMPASS.}$$

- To clarify, first recognize that the value measured in DIS is the matrix element of the quark **axial-vector current operator** in a nucleon state:

$$2a_0 S^\mu = \langle ps | \int d^3x \bar{\psi} \gamma^\mu \gamma^5 \psi | ps \rangle$$

Here, $a_0 = \Delta u + \Delta d + \Delta s$ which is **not** the quark spin contribution calculated in the CQM. The value calculated in the CQM is the matrix element of the Pauli spin part **only**.

The **axial**-vector current operator
can be expanded as:

$$\begin{aligned}
 \int d^3x \bar{\psi} \vec{\gamma} \gamma^5 \psi &= \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \vec{\sigma} \chi_{\lambda'} (a_{i\vec{k}\lambda}^{\dagger} a_{i\vec{k}\lambda'}, -b_{i\vec{k}\lambda}^{\dagger} b_{i\vec{k}\lambda}) \\
 &\quad \text{2x"spin"} \quad \bigcirc \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \frac{\vec{\sigma} \cdot \vec{k}}{k_0(k_0 + m_i)} i \vec{\sigma} \vec{k} \chi_{\lambda'} \\
 &\quad \times (a_{i\vec{k}\lambda}^{\dagger} a_{i\vec{k}\lambda'}, -b_{i\vec{k}\lambda}^{\dagger} b_{i\vec{k}\lambda}) \\
 &\quad \bigcirc \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \frac{i \vec{\sigma} \times \vec{k}}{k_0} \chi_{\lambda'} a_{i\vec{k}\lambda}^{\dagger} b_{i-\vec{k}\lambda'}^{\dagger} + \text{H.c.}
 \end{aligned}$$

Spin is 1/2 of this.

- Only the first term of the axial-vector current operator, which is the Pauli spin part, has been calculated in non-relativistic quark models.
- The second term, the relativistic correction, has not been included in non-relativistic quark model calculations. The relativistic quark model does include this correction and it reduces the quark spin contribution by about 25%.
- The third term, $q\bar{q}$ creation and annihilation, does not contribute in a model with only valence quark configurations and so it has not been calculated in any quark model to our knowledge.

An Extended CQM with Sea Quark Components

- To understand nucleon spin structure quantitatively within the CQM and to clarify the quark spin-axial vector confusion further a CQM was developed with sea quark components:

$$|N\rangle = c_0 |q^3\rangle + \sum C_{\alpha\beta} |(q^3)_\alpha (q\bar{q})_\beta\rangle$$

Is nucleon spin structure inconsistent with the constituent quark model?

NOTE: 3S_1 NOT 3P_0 -- Vector Gluons, not 0^+ pairs

Coupling between 3-quark and 5-quark sectors

$$H = \sum_i \left(m_i + \frac{p_i^2}{2m_i} \right) + \sum_{i < j} (V_{ij}^c + V_{ij}^G) \\ + \sum_{i < j} (V_{i,i'j'j} + V_{i,i'j'j}^\dagger),$$

$$V_{ij}^c = -a_c \vec{\lambda}_i \cdot \vec{\lambda}_j r_{ij}^2,$$

$$V_{ij}^G = V_{ij}^{Gs} + V_{ij}^{Ga},$$

$$V_{ij}^{Gs} = \alpha_s \frac{\vec{\lambda}_i \cdot \vec{\lambda}_j}{4}$$

$$\times \left[\frac{1}{r_{ij}} - \frac{\pi}{2} \left(\frac{1}{m_i^2} + \frac{1}{m_j^2} + \frac{4\vec{\sigma}_i \cdot \vec{\sigma}_j}{3m_i m_j} \right) \delta(\vec{r}_{ij}) + \dots \right],$$

$$V_{ij}^{Ga} = \pi \alpha_s \left(\frac{\vec{\lambda}_i + \vec{\lambda}_j}{2} \right)^2 \left(\frac{1}{3} - \frac{\vec{f}_i \cdot \vec{f}_j}{2} \right)$$

$$\times \left(\frac{\vec{\sigma}_i + \vec{\sigma}_j}{2} \right)^2 \frac{2}{3} \frac{1}{(m_i + m_j)^2} \delta(\vec{r}_{ij}),$$

$$V_{i,i'j'j} = i \alpha_s \frac{\vec{\lambda}_i \cdot \vec{\lambda}_j}{4} \frac{1}{2r_{ij}}$$

$$\times \left\{ \left[\left(\frac{1}{m_i} + \frac{1}{m_j} \right) \vec{\sigma}_j + \frac{i \vec{\sigma}_j \times \vec{\sigma}_i}{m_i} \right] \cdot \frac{\vec{r}_{ij}}{r_{ij}^2} - \frac{2 \vec{\sigma}_j \cdot \vec{\nabla}_i}{m_i} \right\}$$

If one allows sea quark Fock component mixing as shown in Eq. (6) used in our model, then the third term of Eq. (11), the quark-antiquark pair creation and annihilation term, will contribute to the matrix element of QAVCO. Table III shows our model results of the quark spin contents Δq of proton, in fact the matrix element of the QAVCO (axial charge). The experimental value and lattice QCD results are listed for comparison. In Table III, the second column is the q^3 valence quark contribution, where

$$\begin{aligned}\Delta u &= \frac{4}{3} (1 - 0.32)(-0.923)^2, \\ \Delta d &= -\frac{1}{3} (1 - 0.32)(-0.923)^2, \\ \Delta s &= 0, \quad \text{Motion Fock}\end{aligned}\tag{12}$$

the first factors $\frac{4}{3}$, $-\frac{1}{3}$, 0 are the well known proton spin contents of the nonrelativistic quark model. $-0.32 = -1/3m^2b^2$ is the relativistic reduction and -0.923 is the amplitude of the q^3 component of our model. The third column is the contribution of the quark-antiquark pair creation (annihilation) term. It is another important reduction of the quark spin contribution and Δs is mainly due to this term. The fourth column lists the contribution of $q^3 q \bar{q}$ Fock components; due to quark antisymmetrization it cannot be separated into the valence and sea quark part. However, the antiquark contribution is very small (the largest one is $\Delta \bar{d} = 0.004$), and has not been listed in Table III. The fifth column lists the sum. Our model quark spin contents Δu , Δd , and Δs are quite close to the experiment ones in Eq. (3) and column 6, even though we have not made any model parameter adjustments aimed at fitting the proton spin content.

Is nucleon spin structure inconsistent with the constituent quark model?

Department of Physics and Center for Theoretical Physics, Nanjing University, Nanjing 210093,

People's Republic of China

(Received 23 February 1998; published 9 November 1998)

TABLE III. The spin contents of the proton.

	q^3	$q^3 - q^4 \bar{q}$	$q^4 \bar{q} - q^4 \bar{q}$	sum	exp.	lattice [9]	lattice [9,15]
Δu	0.773	-0.125	0.100	0.75	0.80	0.79(11)	0.638(54)
Δd	-0.193	-0.249	-0.041	-0.48	-0.46	-0.42(11)	-0.347(46)
Δs	0	-0.064	-0.002	-0.07	-0.12	-0.12(1)	-0.109(30)

TABLE I. Proton model wave function.

q^3	$N\eta$	$N\pi$	$\Delta\pi$	$N\eta'$	ΛK	ΣK	$\Sigma^* K$
-0.923	0.044	0.232	-0.252	0.065	0.109	-0.036	-0.106

- The quark orbital angular momentum operator can be expanded as:

$$\vec{L}_q = \sum_{i\lambda} \int d^3k (a_{i\vec{k}\lambda}^\dagger i\vec{\partial}_k \times \vec{k} a_{i\vec{k}\lambda} + b_{i\vec{k}\lambda}^\dagger i\vec{\partial}_k \times \vec{k} b_{i\vec{k}\lambda})$$

$$+ \frac{1}{2} \sum_{\lambda\lambda'} \int d^3k \chi_\lambda^\dagger \frac{\vec{\sigma} \cdot \vec{k}}{k_0(k_0 + m)} i\vec{\sigma} \vec{k} \chi_{\lambda'}$$

$$\times (a_{i\vec{k}\lambda}^\dagger a_{i\vec{k}\lambda'}, -b_{i\vec{k}\lambda}^\dagger b_{i\vec{k}\lambda'})$$

$$- \sum_{i\lambda\lambda'} \int d^3k \chi_\lambda^\dagger \frac{i\vec{\sigma} \times \vec{k}}{2k_0} \chi_{\lambda'} a_{i\vec{k}\lambda}^\dagger b_{i-\vec{k}\lambda'}^\dagger + \text{H.c.}$$

- The first term is the nonrelativistic quark orbital angular momentum operator used in the CQM, which does not contribute to nucleon spin in a pure valence S-wave configuration.
- The second term is a relativistic correction, which undoes the relativistic spin reduction.
- The third term is the $q\bar{q}$ creation and annihilation contribution, which also replaces missing spin.

- The quark orbital angular momentum operator can be expanded as:

$$\vec{L}_q = \sum_{i\lambda} \int d^3k (a_{i\vec{k}\lambda}^\dagger i\vec{\partial}_k \times \vec{k} a_{i\vec{k}\lambda} + b_{i\vec{k}\lambda}^\dagger i\vec{\partial}_k \times \vec{k} b_{i\vec{k}\lambda})$$

$$+ \frac{1}{2} \sum_{\lambda\lambda'} \int d^3k \chi_\lambda^\dagger \frac{\vec{\sigma} \cdot \vec{k}}{k_0(k_0 + m)} i\vec{\sigma} \vec{k} \chi_\lambda,$$

$$\times (a_{i\vec{k}\lambda}^\dagger a_{i\vec{k}\lambda'}, -b_{i\vec{k}\lambda}^\dagger b_{i\vec{k}\lambda})$$

$$- \sum_{i\lambda\lambda'} \int d^3k \chi_\lambda^\dagger \frac{i\vec{\sigma} \times \vec{k}}{2k_0} \chi_\lambda a_{i\vec{k}\lambda}^\dagger b_{i-\vec{k}\lambda'}^\dagger + \text{H.c.}$$

Add to half of (see next page) cancels 2nd & 3rd terms.

RECALL:: axial-vector current operator can be expanded as:

$$\begin{aligned}
 \int d^3x \bar{\psi} \vec{\gamma} \gamma^5 \psi = & \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \vec{\sigma} \chi_{\lambda'} (a_{i\vec{k}\lambda}^{\dagger} a_{i\vec{k}\lambda'} - b_{i\vec{k}\lambda}^{\dagger} b_{i\vec{k}\lambda'}) \\
 & \text{2x"spin"} \quad \ominus \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \frac{\vec{\sigma} \cdot \vec{k}}{k_0(k_0 + m_i)} i \vec{\sigma} \vec{k} \chi_{\lambda'} \\
 & \quad \times (a_{i\vec{k}\lambda}^{\dagger} a_{i\vec{k}\lambda'} - b_{i\vec{k}\lambda}^{\dagger} b_{i\vec{k}\lambda'}) \\
 & \quad \oplus \sum_{i\lambda\lambda'} \int d^3k \chi_{\lambda}^{\dagger} \frac{i \vec{\sigma} \times \vec{k}}{k_0} \chi_{\lambda'} a_{i\vec{k}\lambda}^{\dagger} b_{i-\vec{k}\lambda'}^{\dagger} + \text{H.c.}
 \end{aligned}$$

Spin is 1/2 of this.

Sum is spin plus orbital in usual nr sense.

II. Lorentz irreps and angular momentum

Rest Frame Spin- j “Weyl” Spinors

$$\phi_j^R(0^\mu) = \frac{m^j}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ \vdots \\ 0 \end{bmatrix} \quad \phi_{j-1}^R(0^\mu) = \frac{m^j}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ \vdots \\ 0 \end{bmatrix}$$

$$\dots \quad \phi_{-j}^R(0^\mu) = \frac{m^j}{\sqrt{2}} \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 1 \end{bmatrix}$$

Weinberg-Soper
front-form formalism

$$0^\mu \equiv (p^+ = m, p^1 = p^2 = 0, p^- = m)$$

Column Index = $\dot{\xi}$

Wigner Conjugation Operators

$$\Theta_{[1/2]} = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$$

transforms $R = (1/2, 0)$ Weyl
spinor into $L = (0, 1/2)$ spinor

$$\psi_{\frac{1}{2}\zeta}^R \rightarrow \psi_{\frac{1}{2}\zeta}^L$$

$$\Theta_{[1]} = \begin{bmatrix} 0 & 0 & 1 \\ 0 & -1 & 0 \\ 1 & 0 & 0 \end{bmatrix}$$

transforms $R = (1, 0)$ Weyl-like
spinor into $L = (0, 1)$ spinor

$$\phi_{1\zeta}^R \rightarrow \phi_{1\zeta}^L$$

Two independent R 's, one transformed to L
make $(1/2, 0) \oplus (0, 1/2)$ Dirac bispinor

One $R \oplus$ same transformed to L makes
self (or anti-self)-conjugate Majorana bispinor

Similarly for spin-1: self-conjugate bi“spinor” has no charge

After boosting along the 3-axis (quantization axis):

$$\phi_1^R \rightarrow \frac{m}{\sqrt{2}} \begin{bmatrix} \frac{p^+}{m} \\ 1 \\ \frac{m}{p^+} \end{bmatrix}$$

In limit $p^+ \rightarrow \infty$, bispinor $\rightarrow \phi_1^\xi \propto$
 $\xi \sim \{\zeta \dot{\zeta}\}$

$$\begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \\ 1 \end{bmatrix}$$

Wigner-Weyl
representation

ignoring the plane wave factor.

Note that **only** helicity = ± 1 survive
in the **massless limit** -- and only +1
or -1, **violating parity**, for each part
 $\{(1,0)$ or $(0,1)\}$ **separately**.

2nd
state $\phi_1 \sim$ $\begin{bmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \\ 0 \end{bmatrix}$

Structure of spin-1 “Weyl”-spinor, ϕ_1^ξ
 interaction with spin- $\frac{1}{2}$ Weyl-spinor field, χ_ζ :

$$\chi_\zeta^\dagger \bar{\Gamma}_\xi^{\zeta\zeta'} \phi_1^\xi \chi_{\zeta'} \quad \text{using} \quad \left(\frac{1}{2}, 0\right) \otimes \left(\frac{1}{2}, 0\right) = (1, 0) \oplus (0, 0)$$

Is there a Lorentz group Clebsch-Gordan coefficient $\tilde{\Gamma}_\xi^\mu$
 to form a relation to the conventional photon field:

$$\tilde{\Gamma}_\xi^\mu \phi_1^\xi \leftrightarrow \text{parts of } A^\mu \quad \text{RHS in } \left(\frac{1}{2}, \frac{1}{2}\right) \text{ irrep}$$

$$(J = 0 + 1)$$

i.e., in Dirac form:

$$\bar{\Psi} \Gamma_\xi \phi_1^\xi \Psi \quad : \quad \Gamma_\xi \leftrightarrow \gamma_\mu \tilde{\Gamma}_\xi^\mu \quad \text{No?}$$

This leaves some of the possible A_μ components without values.

III. Gauge **non**-Invariance of Pauli Hamiltonian Hydrogen Eigenenergies

$$\begin{aligned} H_D \psi &= i \frac{\partial}{\partial t} \psi \\ &= E \psi \end{aligned} \quad A_0 = \frac{Z}{r}$$

$$H_D = \vec{\gamma} \cdot (\vec{p} - e\vec{A}) + m - eA_0$$

$$\begin{aligned} \vec{J} &= \vec{L} + \vec{S} \\ &= \vec{r} \times \vec{p} + \frac{1}{2} \vec{\Sigma} \end{aligned} \quad \vec{\Sigma} = \begin{bmatrix} \vec{\sigma} & 0 \\ 0 & \vec{\sigma} \end{bmatrix}$$

T. Goldman, *Phys. Rev. D* **15** (1977) 1063.

See also: Wei-min Sun:
Time Evolution Op $\neq \int T_{00}$

$$i \frac{\partial \psi'}{\partial t} = \left(U H U^{-1} - i U \frac{\partial U^{-1}}{\partial t} \right) \psi' \equiv H' \psi'$$

$$U = \exp[-i H f(t)]$$

$$H_P = U H_D U^{-1} - i U \frac{\partial}{\partial t} U^{-1}$$

$$\int d^3x \psi'^{\dagger} H' \psi' = (1 + \dot{f}) \sum_n |c_n|^2 E_n$$

$$\neq \sum_n |c_n|^2 E_n = \int d^3x \psi^{\dagger} H \psi$$

Pauli and Dirac Hamiltonians are **not** unitarily equivalent

$$U = \exp[-iHf(t)] \rightarrow U = e^{[\beta \vec{\alpha} \cdot (\vec{p} - e\vec{A})/2m]}$$

Foldy-Wouthuysen

$$H_P = UH_D U^{-1} - iU \frac{\partial}{\partial t} U^{-1}$$

No problem **only** if:

$$\vec{E} = -\vec{\nabla} A_0 - \frac{\partial \vec{A}}{\partial t}$$

$$\begin{aligned} \vec{\nabla} \cdot \vec{A} &= 0 \\ \vec{\sigma} \cdot \frac{\partial \vec{A}}{\partial t} \times \vec{p} &= 0 \\ \vec{\sigma} \cdot \vec{\nabla} \times \frac{\partial \vec{A}}{\partial t} &= 0 \end{aligned}$$

$$\simeq \beta \left[m + \frac{(\vec{p} - e\vec{A})^2}{2m} \right] - eA_0 - \frac{e}{2m} \beta \vec{\sigma} \cdot \vec{B}$$

$$- \frac{ie}{8m^2} \vec{\sigma} \cdot \vec{\nabla} \times \vec{E} - \frac{e}{4m^2} \vec{\sigma} \cdot \vec{E} \times \vec{p} - \frac{e}{2m^2} \vec{\nabla} \cdot \vec{E}$$

i.e., **OK only in Coulomb gauge**

Gauge-invariant hydrogen-atom Hamiltonian

Wei-Min Sun, Xiang-Song Chen, Xiao-Fu Lü and Fan Wang

Physical Review A 82 (2010) 012107

Time Evolution Op $\neq \int T_{00}$: Generator of time translation is not identical to energy operator

Identifying $A^\mu = (A^0, \vec{A}) = (\frac{e}{4\pi r} - \frac{\partial f}{\partial t}, \vec{\nabla} f)$ as the em field produced by the proton in $M_p \rightarrow \infty$ limit, and solving for H with gauge $\vec{\nabla} \cdot \vec{A} = \nabla^2 f(\vec{x}, t)$

The standard Lagrangian gives the energy of the electron in the field of the proton as: $-e^2/4\pi r$ and hence the Hydrogen Hamiltonian

$$H = \vec{\alpha} \cdot (\vec{p} + e\vec{\nabla} f) + \beta m - \frac{e^2}{4\pi r} = \vec{\alpha} \cdot (\vec{p} + e\vec{A}) + \beta m - eA_{phys}^0$$

Whereas the Dirac equation

$$i\frac{\partial}{\partial t}\psi_e = \left(-i\vec{\alpha} \cdot \vec{\nabla} + e\vec{\alpha} \cdot \vec{\nabla} f + \beta m - \frac{e^2}{4\pi r} + e\frac{\partial f}{\partial t} \right) \psi_e = H_D \psi_e$$

gives $H_D = \vec{\alpha} \cdot (\vec{p} + e\vec{A}) + \beta m - eA^0$ 

which generates time translations but is not equal to the energy (except in Coulomb gauge)

$$e^{-iE_n t} \psi_n(\vec{x}) \rightarrow e^{-ie f} e^{-iE_n t} \psi_n(\vec{x})$$

Some details

$$\partial^2 A^0 - \frac{\partial}{\partial t} \left\{ \frac{\partial A^0}{\partial t} + \vec{\nabla} \cdot \vec{A} \right\} = -\nabla^2 A^0 - \frac{\partial}{\partial t} (\vec{\nabla} \cdot \vec{A}) = e\delta^3(x) + \rho_e$$

$$\partial^2 \vec{A} + \vec{\nabla} \left\{ \frac{\partial A^0}{\partial t} + \vec{\nabla} \cdot \vec{A} \right\} = \vec{j}_e$$

$$A^0(\vec{x}, t) = \frac{e}{4\pi r} - \frac{\partial}{\partial t} f(\vec{x}, t) + \frac{1}{4\pi} \int d^3y \frac{\rho_e(\vec{y}, t)}{|\vec{x} - \vec{y}|}$$

$$\vec{A}(\vec{x}, t) = \vec{\nabla} f(\vec{x}, t) + (\partial^2)^{-1} \vec{j}_e(\vec{x}, t) + \frac{1}{4\pi} \int d^3y (\partial^2)^{-1} \left(\frac{\vec{x} - \vec{y}}{|\vec{x} - \vec{y}|^3} \frac{\partial}{\partial t} \rho_e(\vec{y}, t) \right)$$

The difference of Canonical and Belinfante energy-momentum tensor is a surface term which makes the Belinfante tensor symmetric and gauge invariant. But this does not solve the problem that the average value of the Hamiltonian is gauge dependent.

(EM) multipole radiation
has the same problem

$$A_{phys}^0 = -\frac{1}{\nabla^2} (\rho_p + \rho_e) \text{ does not have a unique solution.}$$

IV. Gauge invariance and canonical angular momentum

Straightforward angular momentum
decomposition **not** gauge invariant:

or **doesn't**
appear to be!

$$\vec{J}_{QED} = \vec{S}_e + \vec{L}_e + \vec{S}_\gamma + \vec{L}_\gamma$$

$$\vec{S}_e = \int d^3x \, \psi^\dagger \frac{\vec{\Sigma}}{2} \psi$$

$$\vec{L}_e = \int d^3x \, \psi^\dagger \vec{x} \times \frac{1}{i} \vec{\nabla} \psi$$

$$\vec{S}_\gamma = \int d^3x \, \vec{E} \times \vec{A}$$

$$\vec{L}_\gamma = \int d^3x \, \vec{x} \times E^i \vec{\nabla} A^i$$

BUT gauge invariant form does **not** obey canonical commutation relations:

$$\vec{J}_{QED} = \vec{S}_e + \vec{L}'_e + \vec{J}'_\gamma$$

$$\vec{S}_e = \int d^3x \, \psi^\dagger \frac{\vec{\Sigma}}{2} \psi$$

$$\vec{L}'_e = \int d^3x \, \psi^\dagger \vec{x} \times \frac{1}{i} \vec{D} \psi$$

$$\vec{J}'_\gamma = \int d^3x \, \vec{x} \times (\vec{E} \times \vec{B})$$

Therefore, despite the labels, \vec{L}'_e and \vec{J}'_γ are **NOT** angular momenta!

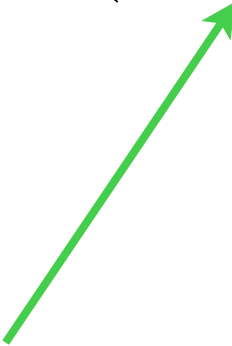

QM example:
$$[(\vec{x} \times \frac{1}{i} \vec{\nabla})_j, (\vec{x} \times \frac{1}{i} \vec{\nabla})_k] = i\epsilon_{jkl} [\vec{x} \times \frac{1}{i} \vec{\nabla}]_l$$

Using the gauge invariant “mechanical”
momentum generates an **extra** term

$$\begin{aligned} & [(\vec{x} \times \frac{1}{i} (\vec{\nabla} - ie\vec{A}))_j, (\vec{x} \times \frac{1}{i} (\vec{\nabla} - ie\vec{A}))_k] \\ &= i\epsilon_{jkl} \{ [\vec{x} \times \frac{1}{i} (\vec{\nabla} - ie\vec{A})]_l + ex_l \vec{x} \cdot (\vec{\nabla} \times \vec{A}) \} \end{aligned}$$

But **OK** if we define a
part of the vector field as $\vec{A} = \vec{A}_{pur}$

such that $\vec{\nabla} \times \vec{A}_{pur} = 0$

See, e.g.: D. Singleton and V. Dzhunushaliev, *Found. Phys.* **30** (2000) 1093.

Both requirements can be satisfied by identifying physical and pure gauge parts of the gauge field:

$$\vec{A} \equiv \vec{A}_{phys} + \vec{A}_{pur} , \quad \vec{D}_{pur} \equiv \vec{\nabla} - ie\vec{A}_{pur}$$

$$\vec{\nabla} \cdot \vec{A}_{phys} = 0 , \quad \vec{\nabla} \times \vec{A}_{pur} = 0$$

$$\vec{J}_{QED} = \vec{S}_e + \vec{L}_e'' + \vec{S}_\gamma'' + \vec{L}_\gamma''$$

$$\vec{S}_e = \int d^3x \psi^\dagger \frac{\vec{\Sigma}}{2} \psi$$

$$\vec{L}_e'' = \int d^3x \psi^\dagger \vec{x} \times \frac{1}{i} \vec{D}_{pur} \psi$$

$$\vec{S}_\gamma'' = \int d^3x \vec{E} \times \vec{A}_{phys}$$

$$\vec{L}_\gamma'' = \int d^3x \vec{x} \times E^i \vec{\nabla} A_{phys}^i$$

NOT Coulomb gauge: $\vec{\nabla} \cdot \vec{A} \neq 0$

$\vec{A} \equiv \vec{A}_{fys} + \vec{A}_{pur}$ only $\vec{\nabla} \cdot \vec{A}_{fys} = 0$

This defines \vec{A}_{pur} piece

Full constraint:

$$F_{pur}^{\mu\nu} = 0$$

$$\begin{aligned} -\vec{E}_{pur} &= F_{pur}^{i0} \\ &= \partial^i A_{pur}^0 - \partial^0 A_{pur}^i \\ &= 0 \end{aligned}$$

$$-(\vec{\nabla})^2 A_{pur}^0 - \partial_t \vec{\nabla} \cdot \vec{A}_{pur} = 0$$

So \vec{A}_{pur} does not contribute to charge either: $\vec{\nabla} \cdot \vec{E}_{pur} = 0$

Cf.: Momentum operator in quantum mechanics

$$\vec{p} = m\vec{\dot{r}} + q\vec{A} = m\vec{\dot{r}} + q\vec{A}_{\perp} + q\vec{A}_{||}$$

$$\vec{p} - q\vec{A}_{||} = m\vec{\dot{r}} + q\vec{A}_{\perp}$$

$$\vec{\nabla} \cdot \vec{A}_{\perp} = 0 \quad \vec{\nabla} \times \vec{A}_{||} = 0$$

Generalized momentum for a charged particle moving in EM field:

- ➡ 1st form is **not** gauge invariant, but **satisfies** the canonical momentum commutation relation.
- ➡ 2nd form is **both** gauge invariant and the canonical momentum commutation relation is satisfied.

We recognize

$$\vec{D}_{pur} = \vec{p} - q\vec{A}_{||} = \frac{1}{\hbar} \vec{\nabla} - q\vec{A}_{||}$$

as the **physical momentum**.

It is **neither the canonical momentum**:

$$\vec{p} = m\vec{\dot{r}} + q\vec{A} = \frac{1}{\hbar} \vec{\nabla}$$

nor the mechanical momentum:

$$\vec{p} - q\vec{A} = m\vec{\dot{r}} = \frac{1}{\hbar} \vec{D}$$

Gauge transformation

$$\psi' = e^{iq\omega(x)}\psi, \quad A'_\mu = A_\mu + \partial_\mu\omega(x),$$

only affects the longitudinal
part of the vector potential:

$$\vec{A}'_{||} = \vec{A}_{||} + \vec{\nabla}\omega(x),$$

and the time component:

$$\phi' = \phi - \partial_t\omega(x).$$

It does **not** affect the
transverse part:

$$\vec{A}'_{\perp} = \vec{A}_{\perp},$$

so A_{\perp} is **physical**.

Hamiltonian of hydrogen atom

Coulomb gauge:

$$\vec{A}_{//}^c = 0, \quad \vec{A}_{\perp}^c \neq 0, \quad A_0^c = \varphi^c \neq 0.$$

Hamiltonian of a nonrelativistic particle:

$$H_c = \frac{(\vec{p} - q\vec{A}_{\perp}^c)^2}{2m} + q\varphi^c.$$

Gauge transformed becomes:

$$\vec{A}_{//} = \vec{A}_{//}^c + \vec{\nabla}\omega(x) = \vec{\nabla}\omega(x), \quad \vec{A}_{\perp} = \vec{A}_{\perp}^c, \quad \varphi = \varphi^c - \partial_t\omega(x)$$

$$H = \frac{(\vec{p} - q\vec{A})^2}{2m} + q\varphi = \frac{(\vec{p} - q\vec{\nabla}\omega - q\vec{A}_{\perp}^c)^2}{2m} + q\varphi^c - q\partial_t\omega.$$

Following this recipe, we introduce a **new** Hamiltonian:

$$H_{fys} = H \boxed{+ q \partial_t \omega(x)} = \frac{(\vec{p} - q \vec{\nabla} \omega - q \vec{A}_{\perp}^c)^2}{2m} + q \varphi^c$$

The matrix elements are **gauge invariant**, i.e.,

$$\langle \psi | H_{fys} | \psi \rangle = \langle \psi^c | H_c | \psi^c \rangle$$

i.e., the hydrogen energy states calculated in Coulomb gauge are **both gauge invariant and physical**.

See also Wei-min Sun.

Coulomb gauge Lorentz invariant: $\partial_k [A^k, J^{ab}] = 0$

-- E. B. Manoukian, *J. Phys. G: Nucl. Phys.* **13** (1987) 1013.

QED:

$$\vec{A}_{pur} = \vec{A} - \vec{A}_{fys}$$

$$F_{pur}^{\mu\nu} = 0 ; F_{fys}^{\mu\nu} = F^{\mu\nu}$$

$$\vec{\nabla} \times \vec{A}_{fys} = \vec{\nabla} \times \vec{A}$$

$$\vec{\nabla} \cdot \vec{A}_{fys} = 0 ; \vec{A}_{fys}(|x| \rightarrow \infty) = 0$$

$$\vec{A}_{fys}(x) = \vec{\nabla} \times \frac{1}{4\pi} \int d^3y \frac{\vec{\nabla}_{(y)} \times \vec{A}(y)}{|\vec{x} - \vec{y}|}$$

$$\vec{A}'_{fys} = \vec{A}_{fys} ; \vec{A}'_{pur} = \vec{A}_{pur} - \vec{\nabla} \omega$$

$$A_{fys}^0(x) = \int_{-\infty}^x dx^i (\partial_i A^0 + \partial_t A^i - \partial_t A_{fys}^i)$$

$$\phi(x) = -\frac{1}{4\pi} \int d^3y \frac{\vec{\nabla}_{(y)} \cdot \vec{A}(y)}{|\vec{x} - \vec{y}|} + \phi_0(x)$$

$$\vec{A}_{pur} = -\vec{\nabla} \phi(x) ; A_{pur}^0 = \partial_t \phi(x) ; \nabla^2 \phi_0(x) = 0$$

Multipole Radiation

Multipole radiation analysis is based on the decomposition of EM vector potential in Coulomb gauge. The results are **physical** and **gauge invariant**, i.e., gauge transformed to other gauges one obtains the **same** results.

$$2P_{3/2} \rightarrow 2P_{1/2} \leftrightarrow \text{spin-flip}$$

$$2P_{1/2} \rightarrow 1S_{1/2} \leftrightarrow \Delta L \text{ of } 1$$

Similarly in Dalitz plot analysis to determine particle spin.

INT2012: Gauge Invariant Extension

There are more gauge invariant operators, Horatio, than are dreamt of in your textbooks

to educate people

-- Chairman Mao
as quoted by X.-S. Chen

V. Gauge Invariance and canonical commutation relation in QCD (for nucleon spin operators)

From the QCD Lagrangian, one can obtain the total angular momentum by a Noether theorem:

$$\vec{J} = \vec{S}_q + \vec{L}_q + \vec{S}_g + \vec{L}_g$$

$$\vec{S}_q = \int d^3x \psi^\dagger \frac{1}{2} \vec{\Sigma} \psi$$

doesn't appear to be gauge invariant!

$$\vec{L}_q = \int d^3x \psi^\dagger (\vec{x} \times \frac{1}{i} \vec{\nabla}) \psi$$

$$\vec{S}_g = 2 \int d^3x \text{Tr} \{ \vec{E} \times \vec{A} \}$$

$$\vec{L}_g = 2 \int d^3x \text{Tr} \{ \vec{x} \times E^i \vec{\nabla} A^i \}$$

- Each term in this decomposition satisfies the canonical angular momentum algebra, so they may properly be called, respectively, quark spin, quark orbital angular momentum, gluon spin and gluon orbital angular momentum operators.
- However they are not individually gauge invariant, except for the quark spin.

→ physical meaning obscure

A Gauge Invariant Decomposition:

$$\vec{J} = \vec{S}_q + \vec{L}'_q + \vec{J}'_G$$

$$\vec{S}_q = \frac{1}{2} \int d^3x \, \psi^\dagger \vec{\Sigma} \psi$$

$$\vec{L}'_q = \int d^3x \, \psi^\dagger \vec{x} \times \frac{\vec{D}}{i} \psi$$

$$\vec{J}'_G = 2 \int d^3x \, \{ \vec{x} \times (\vec{E}^a \times \vec{B}^a) \}$$

- These terms do **not separately** satisfy the canonical angular momentum algebra (except the **quark spin**). In this sense the second and third terms are **not quark orbital** and **gluon** angular momentum operators.
- The physical meaning of these operators is obscure also.
- **Gluon spin** and **orbital** angular momentum operators are **not separately** gauge invariant; only the **total** angular momentum of the **gluon** is gauge invariant.

(Similarly for the photon, but we **do** have **polarized** photon beams!)

Our Solution - A **different** decomposition: Gauge invariance **and** angular momentum algebra **both** satisfied for **individual** terms. Key point is to **separate out** the **transverse** and **longitudinal** parts of the gauge field.

Essential task: to separate properly

the pure gauge field: \vec{A}_{pur}

from the physical one: \vec{A}_{fys}

$$\vec{A} = \vec{A}_{pur} + \vec{A}_{fys} \quad \vec{A}_{\square} = T^a \vec{A}_{\square}^a$$

Fundamental: $\vec{D}_{pur} = \vec{\nabla} - ig\vec{A}_{pur}$

$$\vec{D}_{pur} \times \vec{A}_{pur} = \vec{\nabla} \times \vec{A}_{pur} - ig\vec{A}_{pur} \times \vec{A}_{pur} = 0$$

Adjoint: $\vec{\mathcal{D}}_{pur} = \vec{\nabla} - ig[\vec{A}_{pur}, \]$

$$\vec{\mathcal{D}}_{pur} \cdot \vec{A}_{fys} = \vec{\nabla} \cdot \vec{A}_{fys} - ig[A_{pur}^i, A_{fys}^i] = 0$$

QCD:

$$\vec{\nabla} \cdot \vec{A}_{fys} = ig[A^i - A_{fys}^i, A_{fys}^i] = ig[A^i, A_{fys}^i]$$

$$\vec{\nabla} \times \vec{A}_{fys} = \vec{\nabla} \times \vec{A} = ig(A^i - A_{fys}^i) \times (A^i - A_{fys}^i)$$

$$\partial_t A_{fys}^0 = \partial_i A^0 + \partial_t (A^i - A_{fys}^i) - ig[A^i - A_{fys}^i, A^0 - A_{fys}^0]$$

Solve perturbatively:

$$\vec{\nabla} \times \vec{A}_{pur} = ig\vec{A}_{pur} \times \vec{A}_{pur}$$

$$\vec{\nabla} \cdot \vec{A}_{pur} = \vec{\nabla} \cdot \vec{A} - ig[A_{pur}^i, A^i]$$

$$\partial_i A_{pur}^0 = -\partial_t A_{pur}^i + ig[A_{pur}^i, A_{pur}^0]$$

Gauge transformation:

$$\vec{A}'_{fys} = U \vec{A}_{fys} U^\dagger$$

$$\vec{A}'_{pur} = U \vec{A}_{pur} U^\dagger - \frac{i}{g} U \vec{\nabla} U^\dagger$$

New decomposition

$$\vec{J}_{QCD} = \vec{S}_q + \vec{L}_q'' + \vec{S}_g'' + \vec{L}_g''$$

$$\vec{S}_q = \int d^3x \psi^\dagger \frac{\vec{\Sigma}}{2} \psi$$

$$\vec{L}_q'' = \int d^3x \psi^\dagger \vec{x} \times \frac{1}{i} \vec{D}_{pur} \psi$$

$$\vec{S}_g'' = \int d^3x \vec{E} \times \vec{A}_{fys}$$

$$\vec{L}_g'' = \int d^3x \vec{x} \times E^i \vec{D}_{pur} A_{fys}^i$$

We have chosen a **separation** between **physical** and **gauge** pieces of the gauge vector potential and **consistently separated** the gauge boson and fermion degrees of freedom in the interacting case.

VI. Conclusion_s

The **physical** component of a vector gauge field can be identified in a **gauge covariant** fashion.

The gauge covariant derivatives needed to extract **orbital** angular momentum (and **mechanical** momentum) of fermions coupled to the gauge field must include **only** the non-physical, **pure gauge** part of the vector gauge field so that:

Both gauge invariance and **canonical commutation relations** must be satisfied in order to allow **physical interpretation** of the matrix elements of these operators.

Quark and Gluon momentum contributions are also affected by these considerations:

Do Gluons Carry Half of the Nucleon Momentum?

Xiang-Song Chen,^{1,2,3} Wei-Min Sun,³ Xiao-Fu Lü,² Fan Wang,³ and T. Goldman⁴

¹*Department of Physics, Huazhong University of Science and Technology, Wuhan 430074, China*

²*Department of Physics, Sichuan University, Chengdu 610064, China*

⁴*Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545, USA*

(Received 2 April 2009; published 7 August 2009)

We examine the conventional picture that gluons carry about half of the nucleon momentum in the asymptotic limit. We show that this large fraction is due to an unsuitable definition of the gluon momentum in an interacting theory. If defined in a gauge-invariant and consistent way, the asymptotic gluon momentum fraction is computed to be only about one-fifth. This result suggests that the asymptotic limit of the nucleon spin structure should also be reexamined. A possible experimental test of our finding is discussed in terms of novel parton distribution functions.

$$\mathcal{P}_{q/h}(\xi) = \frac{1}{2} \int_{-\infty}^{\infty} \frac{dx^-}{2\pi} e^{-i\xi P^+ x^-} \langle \bar{\psi}(0, x^-, 0_{\perp}) \gamma^+ \mathcal{P} e^{ig \int_0^{x^-} dy^- A^+(0, y^-, 0_{\perp})} \psi(0) \rangle_h$$

$$\int_{-\infty}^{\infty} d\xi \xi \mathcal{P}_{q/h}(\xi) = \frac{1}{2(P^+)^2} \langle \bar{\psi} \gamma^+ i D^+ \psi \rangle_h$$

$$\mathcal{P}_{q/h}(\xi) = \frac{1}{2} \int_{-\infty}^{\infty} \frac{dx^-}{2\pi} e^{-i\xi P^+ x^-} \langle \bar{\psi}(0, x^-, 0_{\perp}) \gamma^+ \mathcal{P} e^{ig \int_0^{x^-} dy^- A_{pur}^+(0, y^-, 0_{\perp})} \psi(0) \rangle_h$$

$$\int_{-\infty}^{\infty} d\xi \xi \mathcal{P}_{q/h}(\xi) = \frac{1}{2(P^+)^2} \langle \bar{\psi} \gamma^+ i D_{pur}^+ \psi \rangle_h$$

$$\mathcal{P}_{g/h}(\xi) = \frac{1}{\xi P^+} \int_{-\infty}^{\infty} \frac{dx^-}{2\pi} e^{-i\xi P^+ x^-} \langle F^{+\nu}(0, x^-, 0_{\perp}) \mathcal{P} e^{ig \int_0^{x^-} dy^- A^+(0, y^-, 0_{\perp})} F_{\nu}^+(0) \rangle_h$$

$$\mathcal{P}_{g/h}(\xi) = \frac{1}{\xi P^+} \int_{-\infty}^{\infty} \frac{dx^-}{2\pi} e^{-i\xi P^+ x^-} \langle F^{+i}(0, x^-, 0_{\perp}) \mathcal{P} e^{ig \int_0^{x^-} dy^- A_{pur}^+(0, y^-, 0_{\perp})} A_{fys}^i(0) \rangle_h$$

Polarized glue:

$$\mathcal{P}_{\Delta g/h}(\xi) = \frac{1}{\xi P^+} \int_{-\infty}^{\infty} \frac{dx^-}{2\pi} e^{-i\xi P^+ x^-} \langle F^{+i}(0, x^-, 0_{\perp}) \mathcal{P} e^{ig \int_0^{x^-} dy^- A_{pur}^+(0, y^-, 0_{\perp})} \epsilon_{ij} A_{fys}^j(0) \rangle_h$$

Conventional gluon momentum definition:

$$\int d^3x \vec{E} \times \vec{B} \quad \gamma^{\mathcal{P}} = -\frac{\alpha_s}{4\pi} \begin{pmatrix} -\frac{8}{9}n_g & \frac{4}{3}n_f \\ \frac{8}{9}n_g & -\frac{4}{3}n_f \end{pmatrix}$$

becomes

$$\vec{\mathcal{P}}_g^R = \frac{2n_g}{2n_g + 3n_f} \vec{P}_{\text{total}}$$

$$\int d^3x E^i \vec{\mathcal{D}}_{pur} A_{fys}^i$$

$$\gamma^P = -\frac{\alpha_s}{4\pi} \begin{pmatrix} -\frac{2}{9}n_g & \frac{4}{3}n_f \\ \frac{2}{9}n_g & -\frac{4}{3}n_f \end{pmatrix}$$

for $n_f = 5$:
gluon
momentum
fraction

1/2 \rightarrow 1/5

$$\vec{P}_g^R = \frac{\frac{1}{2}n_g}{\frac{1}{2}n_g + 3n_f} \vec{P}_{\text{total}}$$
